

Description

[Weighted blanket for securing infants during sleep.]

DETAILED DESCRIPTION

- [0001] The weighted blanket is comprised of cotton, Velcro, spandex and cotton fabric and polypropylene pellets. The securing effect is the weight of two $\frac{1}{2}$ to 1 pound of removable pellet bags inserted into the left and right sides of the blanket leaving the center empty. Below the weighted blanket is a bottom flap. One end of the flap is sewn into the blanket. The other end of the flap has secured with Velcro.
- [0002] Sewed in and attached to the blanket is a flap where the infant is placed on top. The weighted blanket is placed on top of the infant with the weights on the left and right sides. The infant is secured when the top blanket is Velcro-ed to the bottom flap. This will prevent the blanket from flipping on top of the infant's face, preventing suffocation.

[0003] The use of the weighted pellets for this invention is to provide the infant a secure setting when they are asleep. It dampens the effect of being startling and/or twitching during sleep. The pellet bags are removable from the blanket.
